Power-up Networking for Containers

Jason Messer, *Microsoft*

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Focus and Key Takeaways

- Microsoft is active in and engaged with the FOSS community
- Microsoft understands DevOps and Microservice architectures
- Developers and IT Pros have a different set of concerns
 - Developers want to be agile in development and innovation
 - IT Pros want to provide security and flexibility in deployments
- With Windows Server 2016 and Microsoft Azure Stack (MAS), Software-Defined Networking stacks are improving these experiences and addressing concerns to create synergies between Developers and IT Pros
- Containers and Microsoft Software Defined Networking (SDN) enable “Write once, run anywhere”

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Microsoft FOSS Investments

- Engaged in over a dozen open source projects and standards groups
- Employees are in leadership roles in the Open Source community
 - President of the Apache Software Foundation
 - Co-Chair of the W3C HTML5 Working Group
- Released key projects as open source (e.g. .NET, VS code, etc.)
- Employees are among top contributors to open source (Docker)
- Co-Founder with Docker for Open Container Initiative (OCI)
- AllJoy / AllSeen Alliance (IoT home networking)

SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Microservices

- “Born-in-the-Cloud” applications
- Highly Scalable
- Highly Available
- Modular
- Example
 - Receive request, process request, generate response

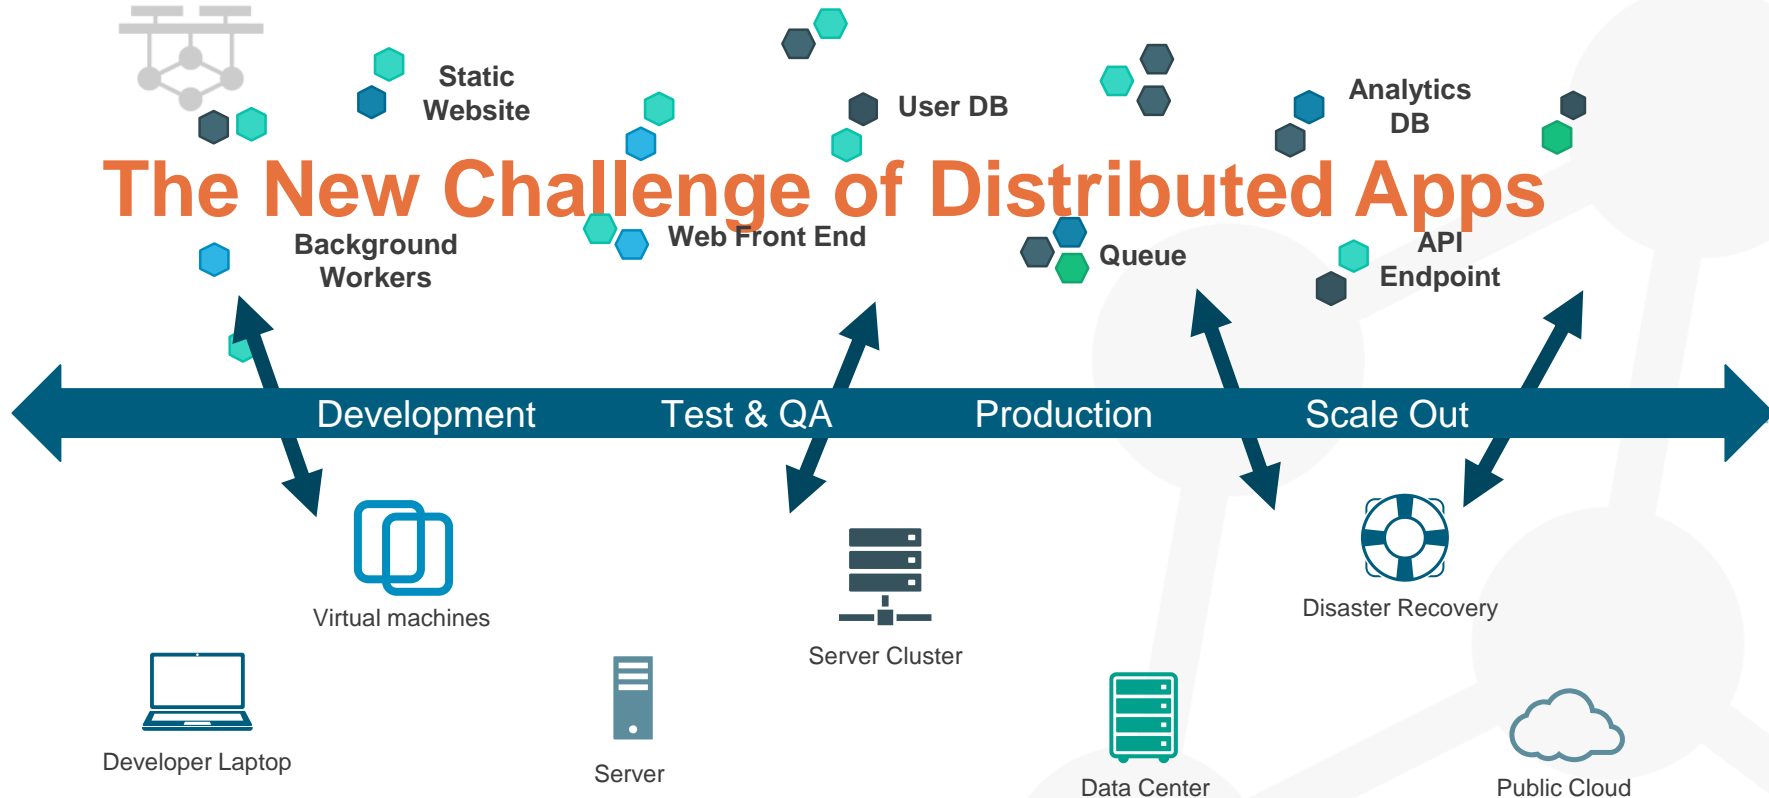

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Three-tier applications vs Micro-services

Container Technology

- Virtual Machines : Hardware Virtualization
- Containers : OS Virtualization
- Isolation
 - Namespaces
 - Resource Control (CGroups)
- Layering
 - Union filesystems (UnionFS)
- Containers
 - Package layers into an image

Windows Server Containers

Anatomy and key capabilities

Build: Developers will use familiar development tools, such as emacs, vi, Visual Studio, to write apps to run within containers.

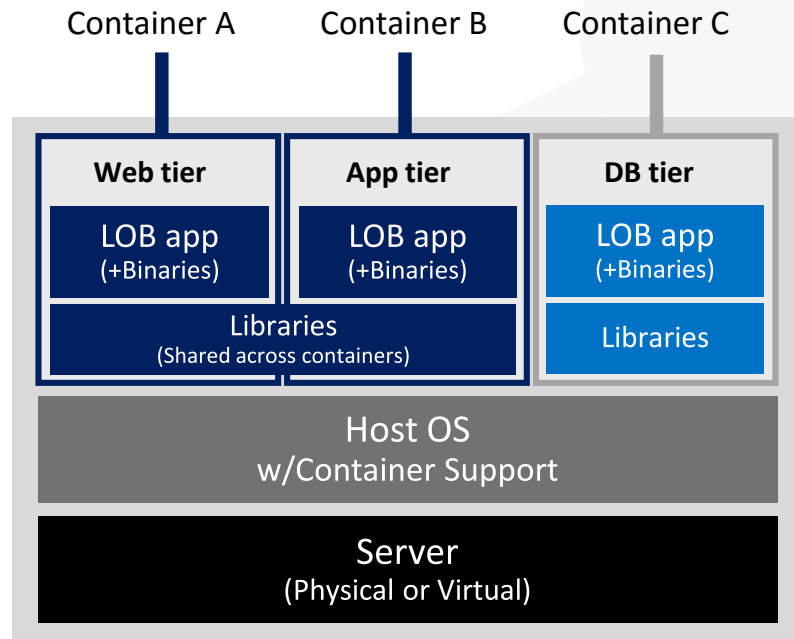

By building modular apps leveraging containers, modules can scale independently, and be updated on independent cadences.

Run: Container capabilities built into Windows Server

Manage: Deploy and manage containers using PowerShell, or using Docker.

Resources: Define CPU and memory resources per container along with storage and network throughput.

Network: Provide four modes of network connectivity (e.g. NAT)

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Hyper-V Containers

Anatomy and key capabilities

Consistency: Hyper-V Containers use the same APIs as Windows Server Containers ensuring consistency across management and deployment toolsets.

Compatibility: Hyper-V Containers use the exact same images as Windows Server Containers.

Strong Isolation: Each Hyper-V container has its own dedicated copy of the kernel

Highly Trusted: Built with proven Hyper-V virtualization technology.

Optimized: The virtualization layer and the operating system have been specifically optimized for containers

Container Deployment			
Container Host Deployment		Server Core	Nano Server
	Server with UI	Windows Server Containers <i>Hyper-V Containers Not Supported In TP4</i>	Hyper-V Container <i>Windows Server Containers Not Supported In TP4</i>
	Server Core	Windows Server Containers <i>Hyper-V Containers Not Supported In TP4</i>	Hyper-V Container <i>Windows Server Containers Not Supported In TP4</i>
	Nano Server	<i>Hyper-V Containers Not Supported In TP4</i>	Windows Server Containers or Hyper-V Container

Docker integration

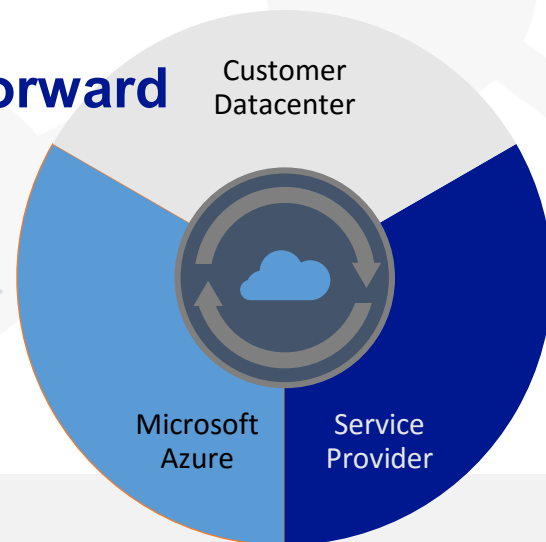

Joint strategic investments to drive containers forward

Docker: An open source engine that automates the deployment of any application as a portable, self-sufficient container that can run almost anywhere.

Partnership: Enable the Docker toolset to manage multi-container applications using both Linux and Windows containers, regardless of the hosting environment or cloud provider.

Run anywhere

Strategic investments

Investments in the next wave
of Windows Server

Open source development of the
Docker Engine for Windows Server

Azure support for the
Docker Open Orchestration APIs

Federation of Docker Hub images into the
Azure Gallery and Portal

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

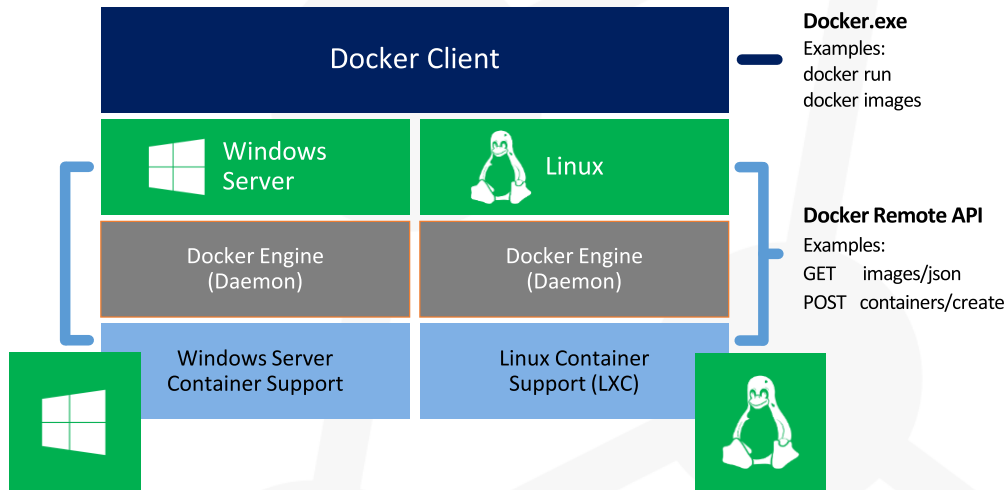

Docker integration

Docker Engine: Docker Engine for Windows Server containers will be developed under the aegis of the Docker open source project.

Docker client: Windows customers will be able to use the same standard Docker client and interface on multiple development environments.

Docker Hub: Huge collection of open and curated applications available for download.

Collaboration: Bring Windows Server containers to the Docker ecosystem to expand the reach of both developer communities.

Quick Windows Container Demo

- Create Windows Container using Docker
- Create Windows Container using PowerShell

```
C:\> docker run --it --name=Container1 windowsservercore cmd.exe
```

```
PS > $container1 = New-Container -Name Container 2 windowsservercore
```

```
PS > Start-Container $container1
```

```
PS > Enter-PSSession -ContainerId $container1.Id -RunAsAdministrator
```

Brief Intro to Windows Container Networking

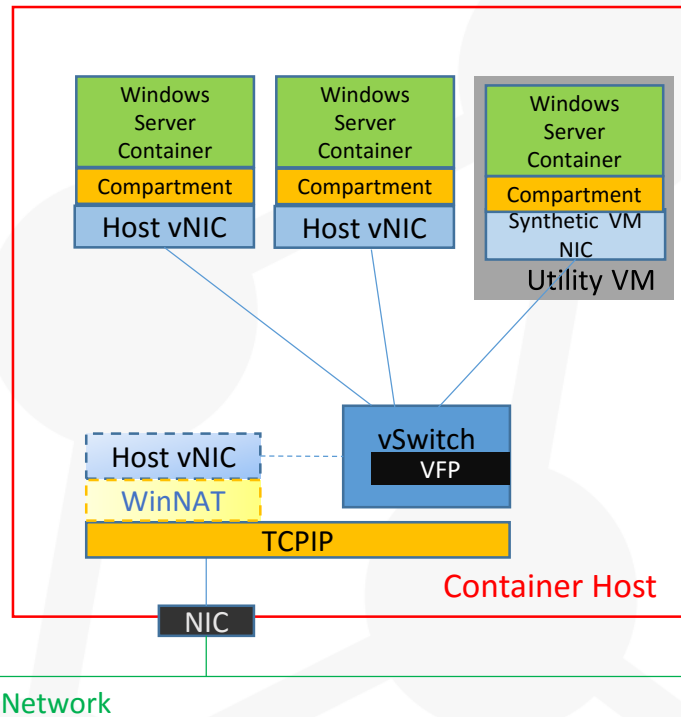

- Windows Container Networking Modes
 - NAT – analogous to Docker “bridge” driver on Linux
 - Transparent – similar to Docker “host” driver on Linux
 - L2 Bridge – used in Microsoft private cloud to **bridge** network traffic and re-write container MAC addresses on the uplink port to the fabric (physical) host – *enables overlay networks*
 - L2 Tunnel – used in Azure public cloud to **forward** all traffic to the fabric (physical) host – *enables overlay networks*
- Docker libnetwork plug-in for Windows new in Technical Preview 5
 - Supports **docker network** commands for Cloud Network Model (CNM)
 - Creates IP endpoints with static and dynamic (ephemeral) port forwarding rules
 - Pull Requests:
 - <https://github.com/docker/docker/pull/20478>
 - <https://github.com/docker/libnetwork/pull/973>

MARCH 14-17, 2016 | SANTA CLARA, CA

Network Stack

- Containers connect to a Hyper-V Virtual Switch over a Host vNIC (Windows Server Container) or Synthetic VM NIC (Hyper-V Containers)
- The Host vNIC / Synthetic VM NIC sits within its own Network Compartment to provide isolation
- Network connectivity to Hyper-V Containers through synthetic VM NIC is transparent to the Utility VM
- (Optional) Host vNIC assigned default gateway IP from WinNAT which binds to TCPIP

The screenshot shows the Microsoft Developer Network (MSDN) website for Windows Containers documentation. The page has a dark header with the Microsoft logo, 'Developer Network', and links for 'Sign in', 'MSDN subscriptions', and 'Get tools'. Below the header is a navigation bar with 'Windows Containers', 'Hyper-V on Windows', and 'Community'. The main content area is titled 'Windows Containers Documentation' and includes a 'Table of contents' on the left. The table of contents lists sections like 'About Windows Containers', 'Container Quick Start', and 'Deploy Windows Containers'. The 'Container Quick Start' section is expanded, showing a 'Quick Start' guide with links to 'Azure Quick Start', 'Deploy New Container Host', 'Deploy Host in Existing System', and 'PowerShell Quick Start'. The main content area also features a 'Contribute to this topic' button and a 'Share' button.

Windows Containers Documentation

Contribute to this topic | Share

mayast | Last Updated: 12/22/2015 | 5 Contributors

Windows Containers provide operating system level virtualization that allows multiple isolated applications to be run on a single system. Two different types of container runtime are included with the feature, each with a different degree of application isolation. Windows Server Containers achieve isolation through namespace and process isolation. Hyper-V Containers encapsulates each container in a light weight virtual machine. In addition to two runtimes, both can be managed with either PowerShell or Docker. This documentation set provides quick start guides, deployment guides, and technical details on management operations.

Quick Start

Try Windows Server and Hyper-V Containers by using the following quick start guides.

- Azure Quick Start
- Deploy New Container Host
- Deploy Host in Existing System
- PowerShell Quick Start

IT Pro Concerns and Challenges

- How do I quickly deploy new microservices?
- How can I guarantee continuous availability?
- How can I be flexible with placement?
- How do I secure the microservices?
- What if I want to scale-up?
- *Does the dev have any requirements or intent I need to meet?*

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Developer + IT Pro

- We need to merge the Dev with the Ops to satisfy concerns of both
- Maintain developer intent with “Write once, run anywhere...”
- Help IT become the hero

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

How can we solve these challenges?

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Software-Defined Networking (SDN)

- What is SDN?
 - Separate the control-planes from the data-planes
 - Based on Layers and Abstractions
- Overlay Virtual Networks
 - Layer-2 Encapsulation (e.g. VxLAN or NVGRE)
- Network policy for virtual networks and endpoints
 - Access Control Lists
 - Quality of Service queues
 - IP Address assignment
- **Goal: *Treat Infrastructure as Code***

OPEN NETWORKING
SUMMIT 2016

Correct Layering

Management

Fabric Administration

- Deployment of Windows Server 2016 Networking Stack
- Deployment of Network Controller, Software Load Balancer Multiplexer & Unified Edge GW VMs

Tenant Administration

- Self-service tenant portal
- Web based UI, REST APIs, PS Cmdlets for tenant workflows
- Azure Resource Manager (ARM)

Control

Network Controller

- Programmatic interface (NorthBound API invoked through PowerShell and REST Wrappers)
- Logically centralized control plane for:
- Comprehensive monitoring of network health

Data

Hyper-V vSwitch/SDN Extension

- Network Policy Enforcement
 - Encapsulation (e.g. VXLAN)
 - QoS max egress caps
 - ACLs

Inbox Virtualized Network Functions

- Multi-tenant gateways: S2S IPSec (VPN) and GRE, L3 Forwarding
- Route Reflector (BGP)
- Software Load Balancer (SLB)

Physical Network Gear

- OMI/DSC based configuration of switches (NetConf coming soon)
- 3rd-party Hardware VXLAN Gateway

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Overlay Virtual Networks

- Encapsulation
 - *Layer-2 Frame encapsulated with header (e.g. VxLAN) and wrapped in outer IP header*
- Network Policy pushed down from the Network Controller
- Network Policy enforced at the vSwitch (Host networking)

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

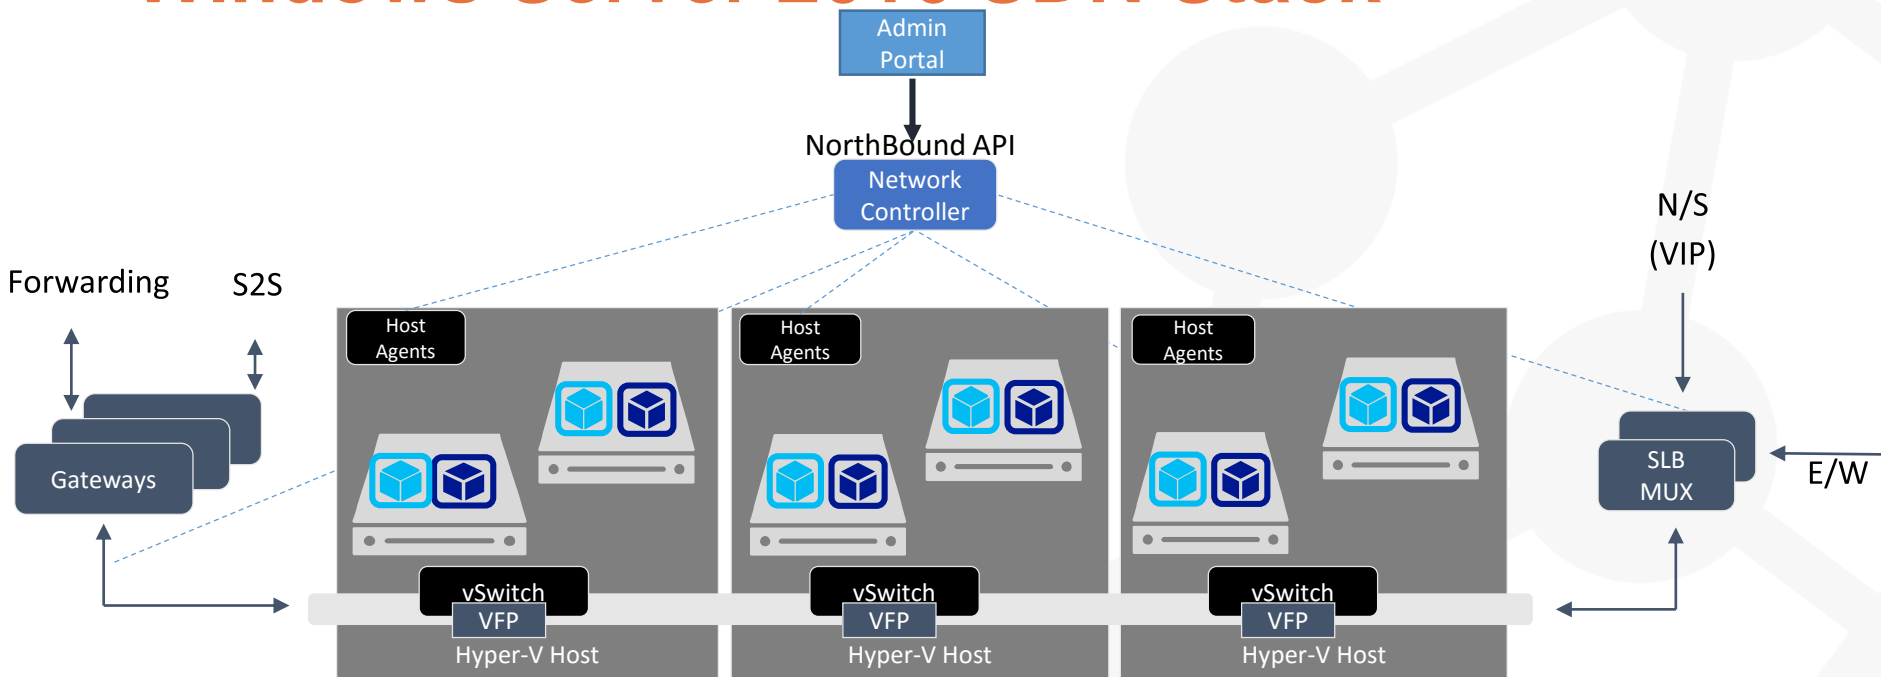

Journey to Microsoft Azure Stack

- Microsoft SDN offering in Windows Server 2012R2 with System Center
 - Policy programmed through PowerShell and System Center Virtual Machine Manager (SCVMM)
 - Overlay Virtual Networks with NVGRE encapsulation
 - Support for ACLs and QoS
 - Extensible Virtual Switch
 - Gateways
- Microsoft Azure Stack with Windows Server 2016
 - Joint-engineering and consistency with Azure
 - SDN Features
 - Network Controller with open and RESTful NorthBound API
 - Overlay Virtual Networks with VxLAN encapsulation
 - Distributed Firewall for ACLs
 - Quality of Service queues
 - Network Function Virtualization (NFV) Features
 - In-Box L4 Software Load Balancer
 - Site-to-Site (S2S) Gateways: IPSec and GRE Tunnels
 - User-Defined Routing for Service Appliance chaining

IT Pro Demo

- Create virtual subnets
- Create Access Control Lists
- Create VMs and assign IP Addresses
- Create containers inside Container Host VM

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

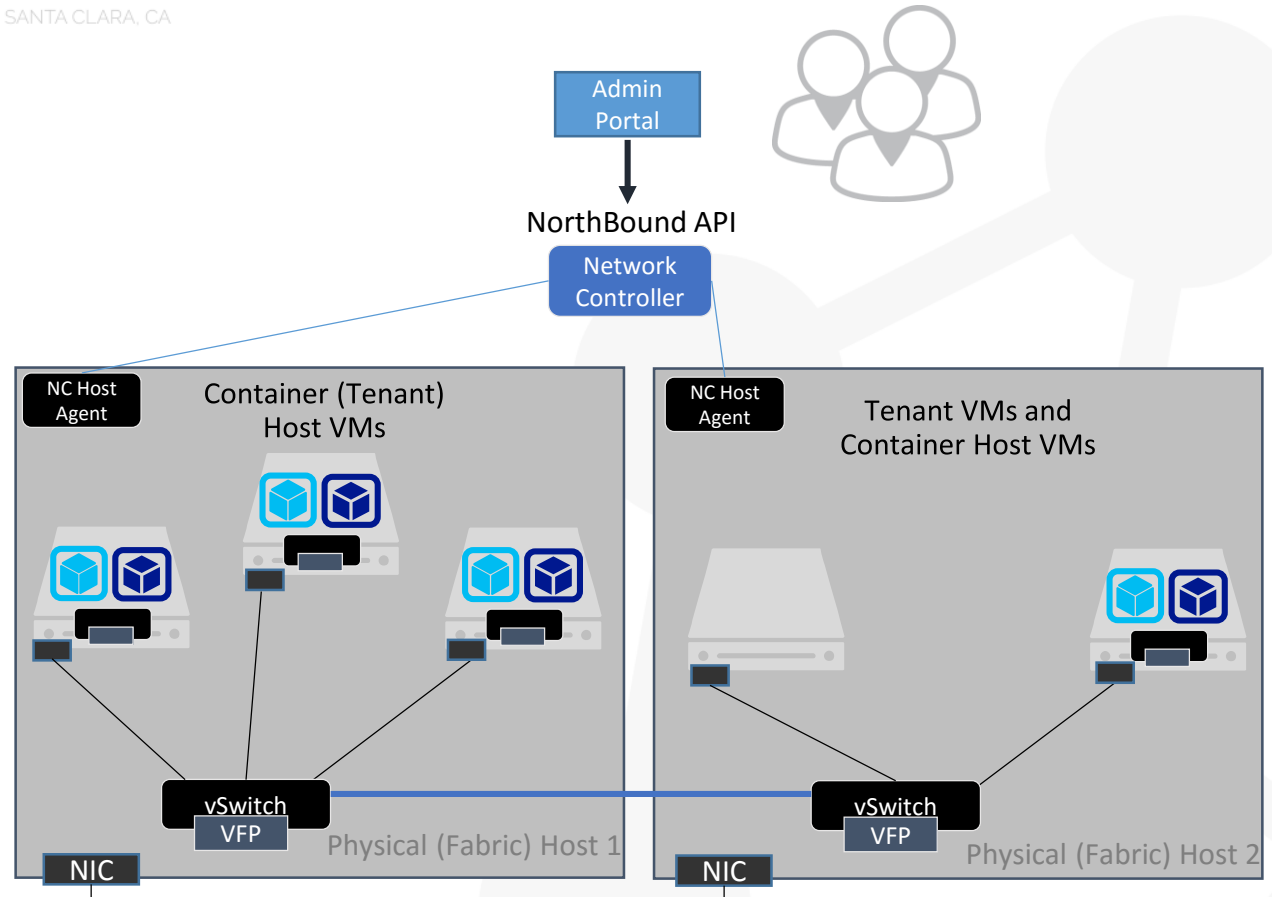

Network Policy Provisioning Approaches

- Private and Public Cloud Approaches for Container Networking
- Top-Down
 - Admin defines network policy (e.g. IP addresses, ACLs, etc.) in admin portal
 - SDN Stack sends policy from admin portal through Network Controller to Container Host
 - Container network policy “ready” to be enforced on physical host
 - Local container host admin creates containers and endpoints
- Bottom-Up
 - Container Host admin creates containers and specifies network policy for endpoints
 - Network policy applied at container host
 - Network policy communicated up the stack

Top-Down Approach

- 1) Create virtual subnet
- 2) Create VMs
- 3) Assign IPs to VMs
- 4) Create containers
- 5) Assign IPs to Containers
- 6) Start Containers

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Innovations

- Incorporate developer intent into higher-level orchestration
- New network modes
 - Transparent
 - L2 Bridge
 - L2 “Tunnel”
- Access Control Lists (ACL)
 - [Available NOW] 5-tuple (Protocol, SRC/DEST IP, SRC/DEST Port) ACL rules
- QoS
 - [Future] Queue assignment on an IP-level granularity
 - [Available NOW] Maximum network bandwidth (egress caps)
 - [Future] Inbound port reservations
- Load Balancing
 - [Future] Layer-4 Software Load Balancer

OPEN NETWORKING
SUMMIT 2016
MARCH 14-17, 2016 | SANTA CLARA, CA

Q&A

- Your Questions!
- My Questions! 😊
 - How do we meet you where you are? Best engagement forum and medium?
 - Do you see a need for enforcing network policy directly on a container host?
 - Will you be deploying containers with other (non-Microsoft) SDN solutions?
 - How important is native support for Docker overlay driver on Windows?
 - What features are we missing?
